

Sales Intelligence Dashboard

1. Project Overview

An interactive sales analytics dashboard built with HTML, CSS, and JavaScript using the AI. The dashboard provides real-time visualization of sales data with filtering capabilities, KPI metrics, and multiple chart views.

Key Features:

- Interactive charts (Bar, Line, Pie, Horizontal Bar)
- Multi-filter system (Date, City, Category, Sales Rep)
- All monetary values displayed in USD
- Monthly sales trend with month names and values
- Complete data overview with modal table
- Excel/CSV file upload support
- Professional dark-blue themed UI

2-Dataset Summary:

Rows: 1288

Columns: 14

Column name (Order ID, Order Date, Customer, City, Region, Product Category, Product Name, Sales Representative, Units Sold, Unit Price, Total Sales, Payment Method, Discount, Profit)

3. Business Problem

Businesses generate large amounts of sales data across different cities, product categories, sales representatives, payment methods, and time periods. However, analyzing this data manually can make it difficult to identify sales trends, evaluate business performance, and understand the factors affecting profitability.

The company needs an interactive sales intelligence solution that can provide a clear overview of sales performance and help management make faster, data-driven decisions.

- Which cities generate the highest and lowest sales?
- Which product categories contribute the most to overall sales?

- Which sales representatives are performing the best?
- How do sales change from month to month?
- Which payment methods are most commonly used?
- How do discounts affect profitability?
- Which products are the top and bottom performers?
- What is the overall sales, profit, order volume, and average order value?

4. Dashboard Components

4.1 Key Performance Indicators (KPIs)

- Total Sales - Sum of all sales in USD
- Total Profit - Sum of all profits in USD
- Orders - Total number of orders
- Avg Order Value - Average sales per order

4.2 Charts

1. City Sales - Bar chart showing sales by city
2. Category Performance - Pie chart with percentages
3. Sales Rep - Bar chart showing sales by representative
4. Monthly Sales Trend - Line chart with month names and USD values
5. Payment Methods - Pie chart with percentages
6. Discount vs Profit - Bar chart showing profit by discount percentage
7. Top 5/Bottom 5 Products - Horizontal bar chart with color coding

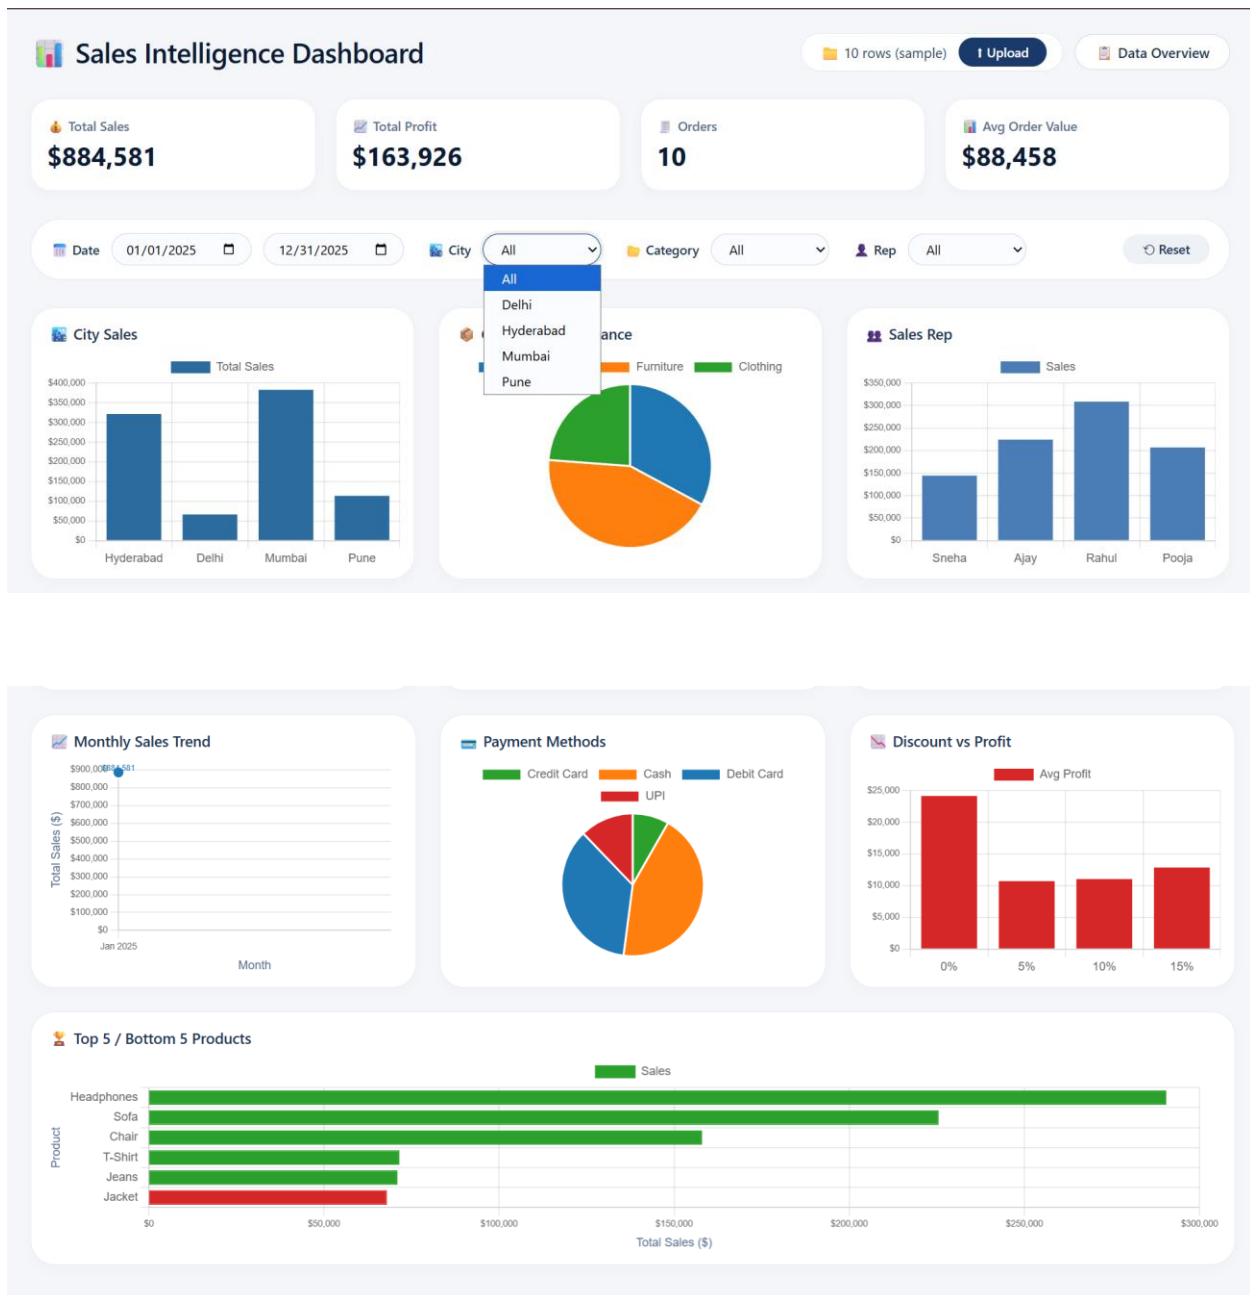

4.3 Filters

- Date range (Start/End)
- City filter
- Category filter
- Sales Rep filter
- Reset button

4.4 Data Management

- Excel/CSV file upload
- Data overview modal showing all records
- Sample data pre-loaded

5. Dashboard:

6. Business Recommendations

Based on the insights available through the dashboard, the following recommendations can help improve sales performance and profitability:

1. Focus on High-Performing Cities

Identify cities generating the highest sales and prioritize them for marketing campaigns, inventory availability, and sales expansion.

At the same time, investigate low-performing cities to understand whether pricing, product demand, sales coverage, or marketing activity is limiting performance.

2. Optimize Product and Category Strategy

Focus on high-performing categories and products by ensuring sufficient inventory and promoting products with strong sales performance.

3. Improve Sales Representative Performance

Use the sales representative analysis to identify top performers and understand the strategies contributing to their success.

4. Optimize Discount Strategies

Analyze the relationship between discounts and profit to identify discount levels that increase sales without significantly reducing profitability.

5. Use Monthly Sales Trends for Planning

Monitor monthly sales trends to identify periods of high and low demand.

Use these insights to plan inventory, marketing campaigns, staffing, and promotional activities around expected sales patterns.

6. Understand Payment Preferences

Monitor customer payment methods to understand customer preferences and ensure that the most commonly used payment options remain easily available.

7. Prioritize High-Performing Products

Increase visibility and availability of top-performing products through targeted promotions and inventory planning.

8. Monitor Profit Alongside Sales

Sales revenue should not be evaluated alone. Management should regularly compare Total Sales, Total Profit, and Average Order Value to ensure that revenue growth is also contributing to healthy profitability.

9. Use Filters for Targeted Decision-Making

The dashboard's filters allow management to analyze specific dates, cities, categories, and sales representatives.

This can help decision-makers move from overall performance analysis to more targeted business investigations.

10. Make Data-Driven Decisions

The dashboard should be used as a regular sales monitoring and decision-support tool. By continuously reviewing sales trends, product performance, profitability, and customer purchasing patterns, the company can respond more quickly to changing business conditions.

7. Expected Business Impact

The Sales Intelligence Dashboard can help the company:

- Improve sales performance
- Increase profitability
- Identify high-performing products and categories
- Optimize discount strategies
- Improve sales representative performance
- Identify high- and low-performing cities
- Understand monthly sales trends
- Support better inventory and marketing decisions
- Make faster, data-driven business decisions
